

Evaluator Inputs — Final v0.01

The evaluator accepts three categories of input:

1. **Request Context**

A description of what is being evaluated, expressed as a request or stated intent, including any relevant contextual parameters.

2. **Declared Attributes**

A set of self-declared attributes associated with the subject of the request. These attributes are accepted as provided and are not validated, verified, normalized, or persisted by the evaluator.

3. **Stated Constraints**

A set of conditions against which the declared attributes are evaluated. Constraints are treated as descriptive logic only and do not represent rules enforced by an authority.

All inputs are evaluated at a single point in time and are treated as contextual representations without implication of trust, control, or governance.
