Evaluator Rationale — Final v0.01

This document introduces a minimal evaluator intended to illustrate how declared attributes and stated constraints may be evaluated in a deterministic and non-authoritative manner.

The evaluator is provided solely as a reference artifact to demonstrate logical flow. It does not assert governance, enforce policy, issue credentials, verify identity, or establish trust. All inputs are treated as contextual and self-declared.

This artifact exists to support comprehension of the coordination model described elsewhere, without introducing platform behavior, institutional assumptions, or implied control.
